Domains

Add Domain

Add domain

You need to add a domain to the filtering system before it will accept email for that domain. Please enter a domain you would like to add to your filtering system e.g. example.com. If no destination mailservers (route) can be determined, you will be asked to enter the route manually. If you want to add more than one destination (in case the first one is not reachable) you can do this later with the "Edit domain" function.

[Upload CSV file \(for adding multiple domains\)](#)

Domain:

MX verification Tool

[Dashboard](#) [MX verification tool](#)
verification

[start](#)

Enter valid MX hostnames:

- Check this box to send an email notification to a customer in case of wrong MX settings
- Skip domains of resellers
- Also verify MX records of domain aliases

Manage Outgoing Users

Authenticating User

Authenticating Domain

Authenticating IP or range

Manage users (example.com)

Underneath you can manage outgoing users. The SMTP AUTH username will be 'Username@example.com', and the password will be 'Password'. If the 'Username' field is left blank, then the SMTP AUTH username will be equal to the domain name. If the 'Password' field is left blank, then the 'Username' must be an IP address, and any connection from that IP will be considered authenticated without needing to use SMTP AUTH.
